Introduction

Population estimates 1979 gives figures for England and Wales, and constituent small areas, which are consistent with those given in the previous volume, for 1977 and 1978.

Figures for Scotland and Northern Ireland are published separately by the respective Registrars General.

Methodology

(i) National estimates for England and Wales

Starting with the previous year's estimate of total population (by sex and single years of age) a new estimate of total population is produced by first ageing the previous estimate by 1 year, then including the current year's births to give the figures for the population less than one year of age, subtracting the numbers who have died and finally adding the differences between the numbers of immigrants and emigrants. All components of change are categorised by sex, and deaths, immigration and emigration are also categorised by single years of age.

By subtracting the numbers of England and Wales residents (by sex and age) who are members of the UK armed forces, an estimate of the civilian population is obtained.

The estimated home population is then computed by adding to the civilian population estimate the numbers of UK and foreign armed forces personnel actually stationed in England and Wales.

The births and deaths figures are each for the period 1 July to 30 June and each is for residents of England and Wales only.

In addition the age-groups of the estimates are based on age at 30 June, so that the age at death is ignored and age at 30 June computed from the stated birth date.

Separate estimates of immigration and emigration are made for Scotland, Northern Ireland, the Republic of Ireland and the Rest of the World.

The estimated migration to and from Scotland is based on a 10 per cent sample of moves recorded at the National Health Service Central Register. The 10 per cent figure is grossed-up and an age structure derived using a five-year moving average. The estimated migration to and from Northern Ireland is obtained in the same way.

The estimates for the Republic of Ireland are based on data provided by the Eire Central Statistical Office. From their estimates of net migration, the numbers of immigrants and emigrants, plus their age and sex structure, are imputed using 1971 Census migration data.

The Rest of the World estimates are based on the results of the International Passenger Survey. After grossing up, an age structure is derived using a five-year average.

(ii) Small area estimates

The methodology for making sub-national estimates is fully described in OPCS Occasional Paper Number 18, *Local authority population estimates methodology*. This is available from OPCS, price 75p.

In order to provide estimates for health districts as well as for county districts, the basic area unit used is the building brick. There are currently 520 building bricks compared to 403 county districts and 219 health districts, and each is a whole county district or a number of whole wards. Births,

deaths and electoral registration figures are available for the building bricks but estimates of the other changes sometimes have to be assigned by allocating the county district figures in proportion to the building bricks' population.

All sub-national estimates, from county district to England or Wales and from health district to regional health authority, are simply aggregates of the constituent building bricks.

Related publications

Population Trends, the OPCS quarterly journal, contains commentary and tables on population estimates. The following issues also contained articles related to the making of estimates.
Population Trends 10 and *12* describe the differences between the old and new series of population estimates.
Population Trends 13 contains an article entitled 'Population estimates 1971-77' which gives the reasons for recalculating the population estimates, describes the main features of the results and discusses the issues that arise in making annual estimates of the population.
Population Trends 20 contains an article, 'Estimating the Population of Local Authorities', describing the methods and rationale of the OPCS population estimates.
Population Trends is published by HMSO and is available from government bookshops and other booksellers.
OPCS Monitors (Series PP1) provide regular updating of population estimates.

OPCS Monitors can be obtained (free of charge) by writing to:

Information Branch (Dept PP1)

For further information about the series of estimates and more detailed figures not published in the above mentioned publications please write to the Population Estimates Unit at the address given above.

Definitions

Home population the population resident in England and Wales

Total population the HOME population plus members of HM Forces belonging to England and Wales serving outside England and Wales minus the Forces of other countries temporarily in England and Wales

Civilian population the TOTAL population minus all members of HM Forces

Standard regions the standard regions of England, as used for statistical purposes, are defined as follows:

North
Cleveland
Cumbria
Durham
Northumberland
Tyne and Wear

Yorkshire and Humberside
Humberside
North Yorkshire
South Yorkshire
West Yorkshire

East Midlands
Derbyshire
Leicestershire
Lincolnshire
Northamptonshire
Nottinghamshire

East Anglia
Cambridgeshire

Commentary

The trend of declining population since 1974 was reversed in 1979 and the estimated home population of England and Wales was the highest ever recorded. The reasons for the increase are seen in **Table 4** to be a combination of a surplus of births over deaths, due to a higher birth rate this year, and a net inflow of migrants.

Large variations in population change persist, both within and between regions. The inter-regional pattern is largely one of decreasing population in the North and increasing population in the South while the intra-regional pattern is movement from inner city areas. The South East, South West and East Anglia regions each had estimated gains of 20,000 or more while the North West region had an estimated loss of over 20,000. The decline in inner city populations is exemplified by the estimated decrease of over 40,000 in the Greater London population compared with the estimated increase of over 66,000 in the rest of the South East region.

The percentage composition of the estimated home population in terms of: pre-school age; school age; labour force; and retired, is shown in **Table A** along with the changes since mid-1978. These figures show the marked decrease in the estimated school age population and an increase in the size of the potential labour force. One reason for this is that those born in the birth peak in the mid 1960s are now reaching school leaving age.

Table A Home population by age-group — **England and Wales**

thousands

Age-group	Mid-1979 home population		Change since mid-1978	
	Number	Per cent	Number	Per cent
Pre-school (0-4 years)	2,937.5	6.0	- 19.1	-0.6
School (5-15 years)	8,358.6	17.0	-163.0	-1.9
Labour force (16-64/59)	29,268.6	59.5	+216.8	+0.7
Retired (65+/60+)	8,606.1	17.5	+ 18.8	+0.2

In addition to the well known surpluses of single males over single females in the lower age-groups, and the surplus of females over males generally in the higher age-groups, the marital condition estimates in **Table 2** show interesting differences in the number of divorced persons. The total number of divorced persons, 1.15 millions, is estimated to be 8.5 per cent higher than the figure for mid-1978. In all age-groups there are more divorced females than divorced males indicating that divorced men are more likely than divorced women to re-marry. In the 35-39 and 40-44 years age-groups there are in fact more women divorced than single while in the age-groups 30-34, 45-49 and 50-54 there are only slightly fewer divorced than single.
